

# Microsoft® BitLocker & ENVAULT™ encryption - Happy co-existence by design

## YOUR ORGANIZATION HAS DEPLOYED OR IS THINKING ABOUT BITLOCKER ENCRYPTION,

but the basic manageability issues and lack of visibility are a let-down?

- You still have no idea about how your company data is being used and whether your security policies are being followed in practice?
- You still have no control whatsoever over data theft in your organization?
- End-user passwords are a daily issue for your help desk?
- And in terms of control, you need more flexibility than just an On/Off switch?

You are not alone - traditional 'dumb' encryption can only get you so far, and these issues are not limited to just BitLocker. But BitLocker has one advantage over the rest - it works seamlessly together with Envault.

## THERE'S AN EASY WAY TO BRING YOUR DATA SECURITY TO THE 21ST CENTURY

As a BitLocker user, you have the chance to easily upgrade your systems with centrally managed encryption, full visibility, and granular control for your data and security policies where and when needed.

Envault helps you to make the most out of your BitLocker licenses, and is your weapon of choice if you suspect that your data is being leaked or stolen, or external auditors ask to see how you fare.

Envault's security solution brings smart enterprise-grade functionalities to 'dumb' encryption and increases both usability and security by removing needless end-user passwords, end-user-based security decisions and other end-user actions.

And what's neat is that you can deploy Envault to your organization in less than one day.

## THREE OPTIONS TO MAKE YOUR LIFE EASIER

Envault offers the following options that allow you to flexibly bring more manageability and usability to your data security when running BitLocker. You can deploy Envault to your whole organization or a part of it, and you can flexibly start with one option and move to the next when it best suits you.

### Option pack 1: Visibility

**THE LIGHTEST FORM OF CO-EXISTENCE:** You can install Envault silently on your workstations to instantly start collecting smart statistics on how your company data is being handled on removable media such as USB drives. You benefit by gaining facts-based data of how your data is used, and by becoming able to locate your information assets across your company endpoints.

Included software: FragmentVault server & Envault Removable Media Protection client for Windows in silent auditing mode. Deployment time: 1-3 hours.

Let Envault audit your organization:

- Automatic statistics and searchable logs of removable media usage
- Graphic reports allow you to see exactly what's going on

### Option pack 2: Control & Visibility

**POWER IS NOTHING WITHOUT CONTROL** – a step up from visibility: Like option 1 but you can exchange “BitLocker to Go” with Envault Removable Media Protection to get more granular control over e.g. which users and user groups can carry data outside your organization's network. You also become able to remotely disable lost or stolen devices with one mouse click. Access control is based on centralized key management instead of end-user passwords, so human error is eliminated and insider data theft can be detected and prevented.

Included software: FragmentVault server & Envault Removable Media Protection client for Windows, Mac and Linux. Deployment time: 3-10 hours.

Upgrade to Envault Removable Media Protection:

- Flexibly manage security rules in AD
- Get rid of user passwords and action
- Remotely disable lost or stolen USB drives
- Share files with Mac & Linux computers

### Option pack 3: Protection, Control & Visibility

**THE ULTIMATE DATA PROTECTION SOLUTION:** Like option pack 2, but you get also the Envault protection and remote control for internal hard disks. Envault Internal Disk Protection protects targeted sections of your hard disks – for example the user folders including profile, desktop and work files. Encrypting the operating system can be left to BitLocker. The two products work seamlessly together and can share the same AD authentication for a beautiful Single-Sign-On experience.

Included software: FragmentVault server, Envault Removable Media Protection client for Windows, Mac and Linux & Envault Internal Disk Protection client for Windows. Deployment time: 1-2 days, may vary depending on your existing PC configuration.

Protect your PCs:

- Centrally manage and oversee smart, targeted encryption of PCs
- Locate documents across your network
- Remotely disable lost or stolen laptops
- SSO user authentication with AD

## FURTHER OPTIONS FOR YOUR ORGANIZATION

Option packs 2 & 3 also enable you to deploy other advanced Envault solutions such as smart backup for your documents, encryption for email attachments, and access control for managing document access rights.
